Revolutionizing Soybean Production: Guruji Mahendra Trivedi's Divine Blessings Propel Agricultural Innovation and Sustainability

Soybeans are a powerhouse crop and a major agricultural commodity for the United States playing a crucial role in both the agricultural and economic landscape. The USA is one of the world's leading soybean producers with over 80 million acres planted annually, producing over 100 million metric tons of soybeans, valued at over \$60 billion. The top five soybean producing states are Illinois, Iowa, Minnesota, Nebraska and Indiana. Soybeans are used in a variety of products, including food, feed, and industrial products. Soybean oil is a major ingredient in cooking oil, margarine, and salad dressings. Soybean meal is a high-protein feed for livestock and poultry. Soybeans are also used to make biodiesel, plastics, and other industrial products. Export markets play a pivotal role, with countries like China, the European Union, and Southeast Asian nations being significant importers of U.S. soybeans.

Soybean production in the USA has witnessed significant growth over the years. The nation's vast agricultural landscape, favorable climate, and technological advancements have propelled it to the forefront of soybean cultivation. According to the United States Department of Agriculture (USDA), the USA consistently ranks among the top soybean-producing countries globally. Soybean cultivation faces several challenges such as microbial infections, pest attacks, climate fluctuations, soil issues, weed issues, and more. Despite immense productivity, soybean farmers face constant challenges. Diseases like soybean cyst nematode, sudden death syndrome and stem canker cause billions in losses each year. Other microbial infections including fusarium and phytophthora blights take a toll. Viral diseases transmitted by insects like bean pod mottle virus also threaten yields.

Weed management is another major concern, as soybeans compete poorly with fast-growing invaders like water hemp and palmer amaranth. Pigweed species have evolved herbicide resistance, making them especially problematic. Weeds not only reduce soybean yields through their competition for nutrients, light, and moisture, but they can also severely reduce harvest efficiency. The weed waterhemp (*Amaranthus tuberculatus*) has a major negative impact on soybean production and poses a difficult challenge for farmers to control. Tall waterhemp's aggressive growth characteristics and ability to outcompete soybean plants for vital resources such as sunlight, water, and nutrients can lead to significant reductions in soybean yields of 20-80% in soybean fields if not adequately managed. Dense populations of tall waterhemp can slow down harvest operations due to its interference with machinery and tangled growth. Tall waterhemp has shown a remarkable ability to develop resistance to multiple classes of herbicides, making control increasingly challenging. Tall waterhemp has spread to over 30 U.S. states and several Canadian provinces over the past two decades. In a research study conducted at two farm sites of Iowa State University in the state of Iowa, USA, the impact of Guruji Mahendra Trivedi's Divine Blessings demonstrated a completely natural, chemical-free approach for greatly reducing the impact of weeds,
